his is a remarkably clean and modern SaaS landing page. It heavily relies on whitespace, soft gradients, and crisp typography—a perfect candidate for Framer.

Given your background in frontend development and UI design, you'll find that Framer bridges the gap between Figma's canvas and production-ready React code perfectly. Where you might normally write CSS Flexbox or Grid, we'll be using Framer's **Stacks** and **Grids**.

Here is your comprehensive A-Z Framer design and implementation document to recreate the "Dreelio" landing page.

---

1. Global Design System (Framer Assets)

Before building sections, set up your shared styles in Framer's **Assets** panel. This ensures consistency and makes future updates instantaneous.

Typography (Text Styles): The font appears to be a modern geometric sans-serif like **Inter**, **Plus Jakarta Sans**, or **SF Pro Display**.

- **H1 (Hero):** 72px, Bold, Tracking -2%, Line Height 1.1.
- **H2 (Section Headers):** 48px, Bold, Tracking -1%, Line Height 1.2.
- **H3 (Card Titles):** 24px, Semi-Bold, Line Height 1.3.
- **Body (Primary):** 18px, Regular, Color: Muted Gray (e.g., #555555), Line Height 1.6.
- **Body (Small/Labels):** 14px, Medium, Color: #888888.

Color Palette (Color Styles):

- **Primary/Text:** #111111 (Near Black - much softer than #000000).
- **Background (Body):** #F9FAFB (Very soft off-white/gray).
- **Surface (Cards):** #FFFFFF (Pure white).
- **Accent (Primary Buttons):** #111111 (Dark theme buttons).
- **Accent (Secondary Buttons):** #E5E7EB (Light gray).
- **Hero Sky Gradient:** Linear or Radial gradient from #BDE3FF (top/sides) fading into #E5EAF0 (bottom).

Shadows (Shadow Styles):

- **Soft Float:** 0px 10px 30px rgba(0,0,0,0.05) — Use for the main dashboard mockup and feature cards.
- **Hover Lift:** 0px 20px 40px rgba(0,0,0,0.08) — Use for card hover states.

---

2. Component Library

Create these as **Framer Components** (Cmd/Ctrl + K) before assembling the page. This is exactly like building a UI kit in Figma or creating reusable React components.

- **Primary Button:** * *Default Variant:* Black background, White text, 16px padding (top/bottom) 24px (left/right), 100px Border Radius (pill shape).
    - *Hover Variant:* Scale 1.05, transition set to Spring (Stiffness: 400, Damping: 30).
- **Secondary Button:** Same as above, but light gray background, black text.
- **Nav Bar:** Contains the Logo (left), Link Stack (center, gap 24px), Button (right). Make the whole component a Stack with Space Between distribution.
- **Feature Card:** Stack layout. Image/Icon on top, Text Stack (Title + Body) below. Add a white background, 24px border radius, and the "Soft Float" shadow.

---

3. Page Architecture & Layout Breakdown

Create a main Desktop frame (usually 1200px or 1440px wide). Set its layout to **Stack** (Direction: Vertical, Gap: 0).

A. Hero Section

- **Layout:** Vertical Stack, Centered alignment.
- **Background:** Apply the "Hero Sky Gradient" to the section frame. Add absolute positioned cloud images to the left and right edges.
- **Content:** Nav Component (top), H1, Subtitle (max-width ~600px for readability), Stack containing the two buttons (gap 16px).
- **Dashboard Mockup:** Place the main UI image below the buttons.
- *Framer Magic (Scroll Transform):* Select the dashboard image. Go to Effects -> Scroll Transform. Set the trigger to On Scroll. Make it move on the Y-axis from +50px to 0px as the user scrolls down, giving it a subtle parallax reveal.

B. Trusted Logos (Ticker)

- **Layout:** Horizontal Stack, masked.
- *Framer Magic (Ticker Component):* Insert Framer’s built-in Ticker component. Drop the logo images inside. Set the speed to slow and seamless loop. Add a linear gradient mask on the left and right edges (white to transparent) to make the logos fade out at the edges.

C. Feature Alternating Sections (Work from anywhere, Track income)

- **Layout:** 2-column Grid (1fr 1fr) or a Horizontal Stack with 50% width children. Gap ~80px.
- **Left Side (Media):** High-quality UI mockups.
- **Right Side (Text):** Vertical Stack (Subtitle, H2, Body text, CTA Button). Left-aligned.
- *Alternating:* On the next section, swap the order (Text on left, Media on right).

D. Bento Box Grid (Features)

- **Layout:** Use Framer's **Grid** tool.

- **Top Row:** Two large cards side-by-side (1fr 1fr). E.g., "Smart, flexible..." and "Integrates seamlessly...".
- **Bottom Row:** A 3-column grid or 4-column grid for the smaller icon-based feature highlights ("Collaborate in realtime", "Speaks your language").

E. Testimonials

- **Layout:** Masonry or Multi-column Grid.
- **Hero Testimonial:** Large text, centered, with an avatar below.
- **Grid:** 3-column grid below it for the smaller quote cards. Each card is a Stack with a white background and subtle border.

F. Pricing

- **Layout:** 3-column Stack or Grid.
- **Cards:** * Left (Free): Simple border.
    - Center (Premium): Dark border or slight background tint to stand out. Add a "Save 20%" badge (Absolute position to top right).
    - Right (Enterprise): Simple border.
- **Toggle:** A pill-shaped component at the top to switch between "Annually" and "Monthly". (You can achieve this in Framer using a Component with two Variants and connecting them with Tap interactions).

G. Blog & Community

- **Layout:** Grid layouts. Standard 3-column for blog posts, 2-column for the Twitter/YouTube community cards.

H. Footer

- **Layout:** A large, light-blue rounded container.
- **Top:** Big CTA ("Ready to get started") centered.
- **Bottom:** Multi-column Stack (Logo left, Links center, Socials right).

---

4. Professional Animations (The Polish)

To make it feel like a premium SaaS site, we don't want static elements. We need everything to breathe as the user scrolls.

1. **Global Appear Effects:** Select almost every major text block (H1s, H2s) and Feature Card on the page.
    - Go to **Effects -> Appear**.
    - Set Animation to Spring (Stiffness: 250, Damping: 30).
    - Set initial state to: Opacity: 0, Offset Y: 30px.

    - *Result:* As the user scrolls, elements will smoothly fade and slide up into place.

2. **Staggered Children:** For grids (like the Bento box features or Blog posts), select the parent Grid/Stack. In the Appear effect, look for **Delay**. You can set a stagger (e.g., 0.1s) so the cards animate in one after another (left-to-right) rather than all at once.
3. **Nav Bar Blur:** If you want the Nav bar to stick, set its Position to Sticky. Give it a semi-transparent background (e.g., rgba(255,255,255,0.7)) and add a **Backdrop Blur** (around 12px) in the styles panel.

5. Responsive Design (Breakpoints)

Framer makes this easier than standard CSS media queries, but you must be deliberate.

- **Tablet (768px):** Change 3-column grids to 2-column. Reduce padding. Reduce H1 size to ~56px.
- **Mobile (390px):** * Change almost all Stacks/Grids to **1 column (1fr)**.
    - The Nav bar should transform into a Hamburger menu (Create a specific mobile variant for your Nav component).
    - Ensure all text is readable (H1 to ~40px). Ensure padding on the left/right of the main container is around 20px so content doesn't touch screen edges.
